

FileCloud Integration with Zapier

Introduction

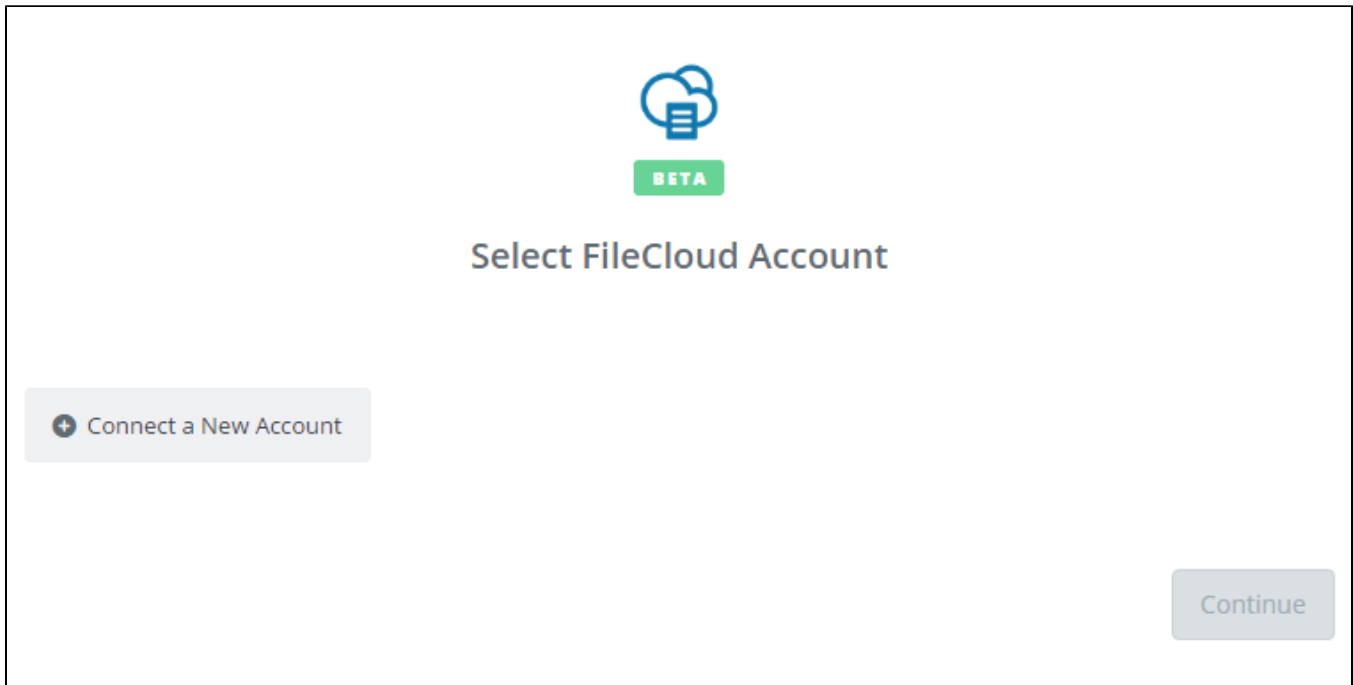

Zapier is a tool that allows you to connect apps to automate tedious tasks. Zapier offers [integration with nearly 750 apps](#) to create automated workflows called as "Zaps". The workflows ("Zaps") are created by mixing a Trigger with actions (Single or Multistep) that are available on your favorite apps. One can link a trigger (Ex: New email attachment in Gmail) from one app to an action (Ex: Upload the attachment to FileCloud Folder) in another app. Using FileCloud - Zapier integration, you can connect FileCloud with many popular apps like Gmail, Trello, Bitbucket, OneDrive, Dropbox, Evernote and many others. The opportunities are simply endless.

For instance, you can automatically upload new Gmail attachments to a FileCloud Folder (or) create a new folder in FileCloud for every Trello Board you create. [Checkout this video](#) for more information.

Steps

Prerequisites: You need to create an account in Zapier as well as have accounts in apps that you wish to connect using Zapier

When you start creating an FileCloud Zap, you will be prompted to connect a New Account:

You should then get a pop-up window asking you your FileCloud Host and login credentials:

Allow Zapier access to your FileCloud account?

FileCloud Host (required)

Account Name (required)

Your FileCloud account name

Password (required)

Your FileCloud password

Yes, continue

Once you've entered your FileCloud Host, login credentials and clicked Yes,continue, we'll test your account to make sure the connection works. If it does, you're all set!
